

JTMS-12: Probability and Random Processes

Fall 2020

M. Bode

Lecture 18

Schwarz Inequality

Consider

$$Z = \sum_{i=1}^n a_i X_i$$

Interesting perspective on

$$\text{Var}[Z] = \text{Var}\left[\sum_{i=1}^n a_i X_i\right]$$

$$= \sum_{i,j=1}^n \text{Cov}[a_i X_i, a_j X_j] = \sum_{i,j=1}^n a_i a_j \text{Cov}[X_i, X_j]$$

$$= (a_1, \dots, a_n) \underbrace{\begin{pmatrix} \text{Cov}[X_1, X_1] & \cdots & \text{Cov}[X_1, X_n] \\ \vdots & \ddots & \vdots \\ \text{Cov}[X_n, X_1] & \cdots & \text{Cov}[X_n, X_n] \end{pmatrix}}_{\text{symmetric matrix } M} \begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix}$$

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Schwarz Inequality

In terms of the vector $(a_1, \dots, a_n)^T$, this is a so-called quadratic form:

$$\text{Var}[Z] = (a_1, \dots, a_n)M \begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix}$$

Realize: No matter what ... this one (being a variance) has to be **non-negative**. Such forms are called **positive semi-definite**.

Real, symmetric matrices can always be diagonalized, and have purely real eigenvalues and eigenvectors.

Consider such an eigenvalue λ and a corresponding eigenvector v

$$0 \leq v^T M v = v^T \lambda v = \lambda \|v\|^2 \Rightarrow \lambda \geq 0$$

That is, **for a positive semi-definite form, all the eigenvalues** of the corresponding real symmetric matrix M **have to be non-negative**.

Lecture 18

Chapter 4: **Expectation and Introduction to Estimation**

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Schwarz Inequality

2x2 case:

$$M = \begin{pmatrix} \text{Cov}[X_1, X_1] & \text{Cov}[X_1, X_2] \\ \text{Cov}[X_2, X_1] & \text{Cov}[X_2, X_2] \end{pmatrix}$$

Eigenvalues $\lambda_1, \lambda_2 \geq 0$

$$\Rightarrow \text{trace}(M) = \lambda_1 + \lambda_2 \geq 0, \quad \det(M) = \lambda_1 \lambda_2 \geq 0$$

Hence,

$$\text{Cov}[X_1, X_1]\text{Cov}[X_2, X_2] - \text{Cov}[X_2, X_1]\text{Cov}[X_1, X_2] \geq 0$$

or

$$\boxed{\text{Cov}^2[X_1, X_2] \leq \text{Var}[X_1]\text{Var}[X_2]}$$

Lecture 18

Schwarz Inequality

... and similar observations

Chapter 4: **Expectation and Introduction to Estimation**

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

$$E \left[\left(\sum_{i=1}^n a_i X_i \right)^2 \right] = (a_1, \dots, a_n) \underbrace{\begin{pmatrix} E[X_1^2] & \cdots & E[X_1 X_n] \\ \vdots & \ddots & \vdots \\ E[X_n X_1] & \cdots & E[X_n^2] \end{pmatrix}}_{\text{symmetric matrix}} \begin{pmatrix} a_1 \\ \vdots \\ a_n \end{pmatrix}$$

Same line of thought ...

$$\boxed{E^2[X_1 X_2] \leq E[X_1^2] E[X_2^2]}$$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Schwarz Inequality

Interpretation:

Random variables X, Y can be seen as vectors in an (infinite dimensional) vector space.

The joint moment

$$E[XY] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} xy f_{XY}(x, y) dx dy$$

of two random variables (if it exists) is a scalar (or inner) product, and

$$\frac{E[XY]}{\sqrt{E[X^2]E[Y^2]}} = \cos(\varphi)$$

defines an angle enclosed by X and Y .

$$E[XY] = 0 \Leftrightarrow X \perp Y$$

for non-zero X, Y .

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Schwarz Inequality

Interpretation:

In this sense,

$$\text{Cov}[X, Y]$$

is the scalar (inner) product of $(X - \mu_X)$ and $(Y - \mu_Y)$

enclosing an angle φ , such that

$$\cos(\varphi) = \frac{\text{Cov}[X, Y]}{\sigma_X \sigma_Y}$$

Hence, we interpret:

$$\rho = \frac{\text{Cov}[X, Y]}{\sigma_X \sigma_Y} = \cos(\varphi)$$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Moment Generating Functions

$$\theta_X(t) \stackrel{\text{def}}{=} E[e^{tX}] = \int_{-\infty}^{\infty} e^{tx} f_X(x) dx, \quad \text{for } t \in \mathbb{C}$$

... usually, this exists only for some $t \in \mathbb{C}$.

Mind: Except for $t \leftrightarrow -t$, this is the so-called **bi-lateral Laplace transform** of the pdf.

Relation to moments ... if they exist:

$$E[e^{tX}] = E \left[1 + tX + \frac{1}{2} (tX)^2 + \frac{1}{6} (tX)^3 + \dots \right]$$

$$= 1 + t\mu + \frac{t^2}{2} E[X^2] + \frac{t^3}{6} E[X^3] + \dots$$

$$\Rightarrow E[X^k] = \left. \frac{d^k}{dt^k} \theta_X(t) \right|_{t=0}$$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Example 1:

Consider a normal r.v. $X \sim \mathcal{N}(\mu, \sigma^2)$

$$\theta_X(t) = E[e^{tX}] = \frac{1}{\sqrt{2\pi\sigma^2}} \int_{-\infty}^{\infty} e^{tx} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) dx$$

Complete the square as we did before ...

$$\begin{aligned}\theta_X(t) &= \frac{1}{\sqrt{2\pi\sigma^2}} \int_{-\infty}^{\infty} \exp\left(-\frac{x^2 - 2\mu x + \mu^2 - 2\sigma^2 tx}{2\sigma^2}\right) dx \\ &= \exp(\mu t + \sigma^2 t^2 / 2) \cdot \frac{1}{\sqrt{2\pi\sigma^2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2} (x - (\mu + \sigma^2 t))^2\right) dx \\ &\Rightarrow \theta_X(t) = \exp\left(\mu t + \frac{\sigma^2 t^2}{2}\right)\end{aligned}$$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Example 1 contd ...

$$\theta_X(t) = \exp\left(\mu t + \frac{\sigma^2 t^2}{2}\right)$$

Find

$$E[X^0] = \theta(0) = 1$$

$$E[X] = \theta'(0) = (\mu + \sigma^2 t) \exp\left(\mu t + \frac{\sigma^2 t^2}{2}\right) \Big|_{t=0} = \mu$$

$$\begin{aligned} E[X^2] = \theta''(0) &= \{\sigma^2 + (\mu + \sigma^2 t)^2\} \exp\left(\mu t + \frac{\sigma^2 t^2}{2}\right) \Big|_{t=0} \\ &= \sigma^2 + \mu^2 \end{aligned}$$

→ $Var(X) = ?$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Example 2:

Consider a binomial r.v. X with parameters k, n, p

$$\theta_X(t) = E[e^{tX}] = \sum_{k=0}^n e^{tk} \binom{n}{k} p^k q^{n-k}$$

$$= \sum_{k=0}^n \binom{n}{k} (e^t p)^k q^{n-k}$$

$$\Rightarrow \theta_X(t) = (e^t p + q)^n$$

$$E[X^0] = \theta(0) = 1$$

$$E[X] = \theta'(0) = n(e^t p + q)^{n-1} e^t p \Big|_{t=0} = np$$

$$\begin{aligned} E[X^2] &= \theta''(0) = n(n-1)(e^t p + q)^{n-2} e^{2t} p^2 + n(e^t p + q)^{n-1} e^t p \Big|_{t=0} \\ &= npq + n^2 p^2 \end{aligned}$$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Example 3:

Consider two independent r.v.s X and Y with pdfs $f_X(x)$ and $f_Y(y)$. Find the MGF of their sum $Z = X + Y$.

$$\begin{aligned}\theta_Z(t) &= E[e^{t(X+Y)}] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{t(x+y)} f_X(x) f_Y(y) dx dy \\ &= \int_{-\infty}^{\infty} e^{tx} f_X(x) dx \int_{-\infty}^{\infty} e^{ty} f_Y(y) dy = \theta_X(t) \theta_Y(t)\end{aligned}$$

Lecture 18

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

Apply ...

From this perspective, interpret the previous result:

For a binomial r.v. X : $\theta_X(t) = (e^t p + q)^n$

What is the MGF of a sum of n i.i.d normals $X \sim \mathcal{N}(\mu, \sigma^2)$

$$Z = \sum_{i=1}^n X_i$$

For each summand:

$$\theta_X(t) = \exp\left(\mu t + \frac{\sigma^2 t^2}{2}\right)$$

$$\theta_Z(t) = [\theta_X(t)]^n = \exp\left(n\mu t + n\frac{\sigma^2 t^2}{2}\right)$$

What's that?

Lecture 18

(Joint) Moment Generating Functions

Chapter 4: Expectation and Introduction to Estimation

4.1 Expected Value of a R.V.

4.2 Conditional Expectations

4.3 Moments

4.4 Chebyshev & Schwarz

4.5 Moment Generating Functions

4.6 Chernoff Bound

4.7 Characteristic Functions & Central Limit Theorem

4.8 Estimators for Mean and Variance

$$\begin{aligned}\theta_{XY}(t_1, t_2) &\stackrel{\text{def}}{=} E[\exp(t_1X + t_2Y)] \\ &= \int_{-\infty}^{\infty} \exp(t_1x + t_2y) f_{XY}(x, y) dx dy\end{aligned}$$

Relation to moments ... if they exist:

$$\begin{aligned}E[X] &= \frac{\partial}{\partial t_1} \theta_{XY}(t_1, t_2) \Big|_{(t_1, t_2) = (0, 0)} & E[X^2] &= \frac{\partial^2}{\partial t_1^2} \theta_{XY}(t_1, t_2) \Big|_{(t_1, t_2) = (0, 0)} \\ E[Y] &= \frac{\partial}{\partial t_2} \theta_{XY}(t_1, t_2) \Big|_{(t_1, t_2) = (0, 0)} & E[Y^2] &= \frac{\partial^2}{\partial t_2^2} \theta_{XY}(t_1, t_2) \Big|_{(t_1, t_2) = (0, 0)}\end{aligned}$$

$$E[XY] = \frac{\partial^2}{\partial t_1 \partial t_2} \theta_{XY}(t_1, t_2) \Big|_{(t_1, t_2) = (0, 0)}$$

The End
